Problem Statement: Students often struggle with not being able to remember how many retail swipes they've spent every week which can result in them thinking they have more retail swipes left than they have, or not spending all of their swipes for a week.

Most freshmen and a large population in general of the students at USC have retail swipes as a part of their meal plan. Students either get 7 or 10 retail swipes per week depending on the plan they choose. One problem that I have noticed others dealing with, and that I deal with myself, is that there is no tracker that keeps count of how many retail swipes we have left per week. Students can look on GetMobile to see recent purchases, but it isn't very clear and doesn't have any sort of weekly countdown for the number of retail swipes students have left. By not knowing how many retail swipes students have left, they can end the week not spending all of them (and therefore not getting their money's worth) or can think they have enough for another meal and end up getting their order cancelled. In order to solve this problem, I'm planning to create an app that shows how many retail swipes students have left so they don't run into these issues anymore.
